ABSTRACT

A first abutment surface 24 for restricting an initial position of a hinge main body 5, and a second abutment surface 25 for restricting a terminal position of the hinge main body 5 are formed on the transmission case 2. A third abutment surface 34 for restricting an intermediate position of a reception case 3 is formed on the reception case 3. Between the transmission case 2 and the hinge main body 5, there are provided a first turn biasing means (not shown) adapted to turn bias the hinge main body 5 to the initial position, and a second turn biasing means (not shown) adapted to turn bias the hinge main body 5 to the terminal position. Between the reception case 3 and the hinge main body 5, there are provided a third turn biasing means (not shown) adapted to turn bias the reception case 3 to a folded position, and a fourth turn biasing means (not shown) adapted to turn bias the reception case 3 to a transmission position. The turn biasing force of the first turn biasing means is larger than that of the third turn biasing means. The turn biasing means.
